

Simpson® Nantucket® Collection doors are the toughest wood doors available. All the components of the Nantucket door are solid wood. The stiles and rails utilize a two-piece laminated construction, resulting in a straighter and more stable stile.

Innerbond® panels are created with offsetting grain patterns to provide extra strength to resist warping and splitting.

The Nantucket® door is joined with a modified mortise-and-tenon. A large mortise is cut into both the stile and rail. Glue is added to the mortise of the stile and a tenon is inserted.

Mortise cut into Stile

Adding glue to Mortise

Additional glue is added to stile and along the entire coped area. Then the stiles and rails are assembled together.

Brushing glue on coped area

Stiles and Rails coming together

A wood pin is driven into the face of the door to join the components together. The result is a unique beauty and durability that is only found in the Nantucket® collection.

Hammering in Face Pin

In addition to advanced durability they have exquisite detail and feature a flat or double hip raised panel and have the choice to include a variety of glass options.
