

Simpson's Performance Series® doors include components that provide additional protection to your door in harsh weather conditions.

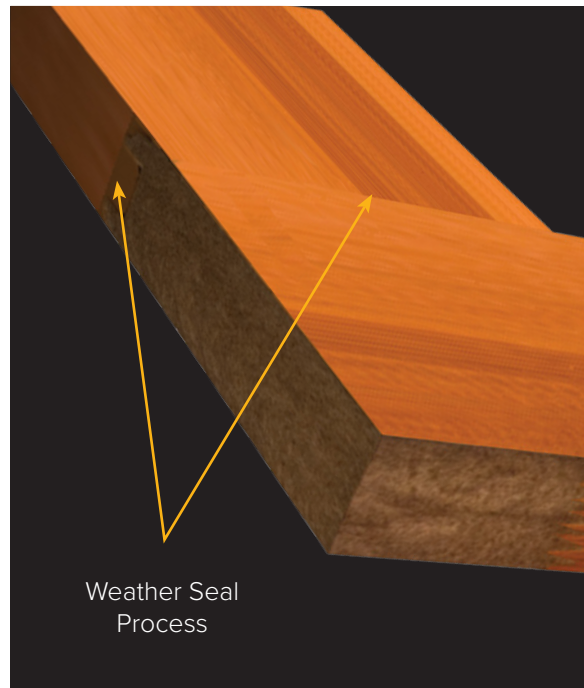

Performance Series doors utilize three moisture blocking features. First, they utilize UltraBlock® Technology which is a 4" water-resistant composite block added to the bottom of both door stiles.

Second, they feature the Weather Seal process where glue is applied along the entire coped area of the stile blocking water absorption and enhancing the glue joints.

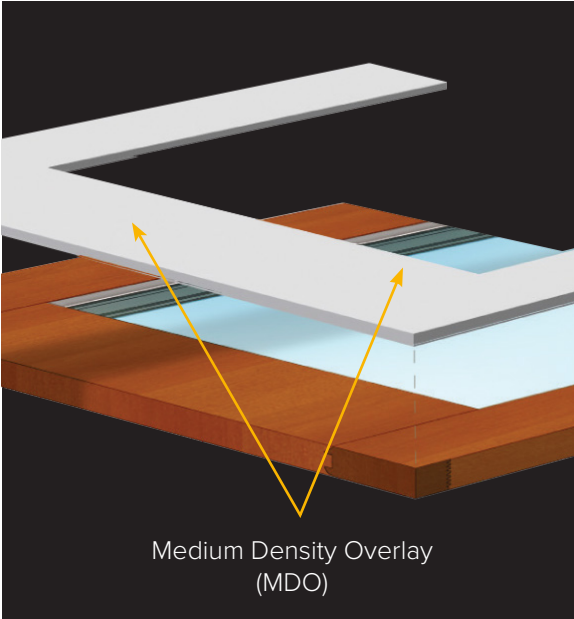

Finally, all Simpson Performance Doors come with a solid bottom rail. Solid lumber is very durable especially in this vulnerable area of the door. By incorporating all three of these into a door, the entire bottom of the door is protected against moisture penetration.

Included as part of the Performance Series[®] doors is the WaterBarrier[®] Series. WaterBarrier doors combine a Medium Density Overlay (MDO) with water-resistant glazing beads and bars to create an exterior that stops water in its tracks.

WaterBarrier technology can be used on virtually any species to receive the highest protection on the exterior of the door while getting the unmatched beauty of a real wood door on the inside.

The Performance Series® takes an amazing wood door crafted with impeccable details and gives it an additional layer of security. Doors with both Performance features and WaterBarrier® technology create a door suited for the toughest exposures. Beauty is important in any door, but a beautiful door is only worth having if it lasts.
